SYLLABUS

Course Objectives

- The purpose of this course is to introduce to the students the principal definitions of organic polymers and composites, their respective properties, rheology and processing as well;
- It also provides some fundamental knowledge of different new materials developed and their application in the design and the use for automotive, marine and aircraft manufacturing.;
- Ultimately the course should offer to the students the ability to engineer properties combining the design of the composites to fulfill the properties of the materials required v.z.-Nature of fibers & matrices - Orientation and fibers architecture -Arrangement of folds -Laminate & lamina stacking.

On completion of this course, the students should be able to:

- understand the main difference between thermoplastics, thermosets and elastomers;
- understand basic definition, properties and difference between polymers and composites;
- understand important relationships between structure and properties of polymers and composites;
- understand the advantages and limitations of both type of materials;
- have a better understanding and approach of polymer and composite processing.
